The Editors, Advisory editors, and the Editor-in-Chief of the ACTA Neurology Journal are committed to serving the Neurological and Neurosurgery community by providing access to read and publish the scope of papers presented in our fields. We, as a professional and tight knit community, are continually reviewing the nature and scope of our journals and considering ways in which we can serve our authors, our readership, and the society. The transition in which we monitor the manuscripts submitted to our journals has appropriate ways to monitor the quality of science that is funded and published while there is no consensus on the most effective or efficient methods.

The main objective of this neurology journal is to act as a forum for publication, education, exchange of opinions regarding said subjects in the field, and to promote research and publications globally. ACTA Neurology publishes original research articles, reviews, personal views, commentaries, and news in clinical and standard neurology for use in assessing baselines and outcomes of various procedures in select journals. Otherwise, publications are invited in all areas of clinical and basic neuroscience, including new technologies, cellular, molecular, Neurosurgery, and other basis for Neurology.
